NORTHERN-GROWN ROSES

J. C. Thornton

Julien Potin

Miss Rowena Thom

Rev. F. Page-Roberts

UR ROSES are all budded, two-year, field-grown, under the most ideal conditions to be found the world over, and backed by experience extending to forty years in Rose-growing. We can, therefore, offer our customers a product which is a result of the most favored conditions and cultural skill combined with the utmost hardiness induced by the rigorous winters of our northern climate.

Mail and express parcels can reach the most distant points in the United States within one week. Direct producer to consumer business offers the best quality at the lowest price.

Our financial reference is the Nooksack Valley State Bank, Everson, Wash.

PRUNING AND CARE. Plants are first graded, then pruned before shipment, ready for planting. Immediately on receipt, immerse the plants in water for 24 hours. When planting, see that the roots are not twisted and that they are set deep enough—one inch below the point of branching out is about right. The earth should be tramped in quite solid, and then a loose mulch hilled up over the plant for two weeks to prevent drying out. Water freely, and see that they are kept free from insect pests and diseases.

ORDERS will be filled strictly in rotation as received. When a variety is sold out, another will be substituted unless otherwise instructed.

Climbing Rose, American Beauty

Climbing Rose, Primrose

ROSE CULTURE

SOIL PREPARATION

Roses will grow in any good soil. However, the average soil in our cities and towns is not fertile, so that tilling and feeding is essential. The soil should be dug about 18 inches deep, and the top soil and subsoil placed in different piles. Into the subsoil mix a goodly amount of well-rotted cow- or horse-manure, and into the top soil, a mixture of bonemeal and sheep manure.

PLANTING

Any damaged or broken roots should be cut off with a sharp knife. Prune the larger shoots to 6 to 8 inches and cut out the small weak ones. Never plant if the roots are dry—soak them well. Plant Roses about 18 inches apart, at a depth, just covering the bud, which is the point from which the branches begin.

FERTILIZATION

If the original bed is well prepared there will be no need for additional fertilizer for two or three years. Then add a mixture of bonemeal and sheep manure, spread on the surface and rolled into the soil to prevent being washed away when watered.

WINTER PROTECTION

Hill up the plants 8 to 12 inches high with ordinary garden loam

SPRING UNCOVERING

Do not remove protection until spring has definitely come. Then remove about one-half the mulch and in two weeks remove the rest.

PRUNING

About the time they are uncovered, cut off all the dead wood and prune the live wood within a few inches of the ground for a few exhibition flowers, and 8 to 12 inches for a quantity of good flowers.
